- Summary

Colloquium: Quantum fluctuation relations: Foundations and applications

Michele Campisi, Peter Hänggi, and Peter Talkner Rev. Mod. Phys. 83, 771 – Published 6 July 2011; Erratum Rev. Mod. Phys. 83, 1653 (2011) PERSPECTIVE | INSIGHT

The other QFT

P. Hänggi, P. Talkner, Nature Physics **11**, 108 (2015).

Jarzynski equality

 $H(\lambda)$:

system Hamiltonian, λ : classical parameter

 $\Lambda = \{\lambda(t) | 0 \le t \le \tau\}:$ protocol w: Work performed on the system

$$\langle e^{-eta w}
angle = e^{-eta \Delta F}$$

Jarzynski, PRL 78, 2690 (1997).

 $\langle \cdot \rangle$: average over realizations of the same protocol $\Delta F = F(\tau) - F(0), \quad F(t) = -\beta^{-1} \ln Z(t), \quad Z(t) = \operatorname{Tr} e^{-\beta H(\lambda(t))}$

Jensen's inequality $\implies \langle w \rangle > \Delta F$ 2nd law

Crooks relation

 $p_{\Lambda}(w) = e^{-\beta(\Delta F - w)} p_{\bar{\Lambda}}(-w)$ G.E. Crooks, PRE **60**, 2721 (1999)

 $p_{\Sigma}(w)$: pdf of work w during protocol $\Sigma = \Lambda, \overline{\Lambda}$

 $Crooks \Rightarrow Jarzynski$

Applications

Pulling macromolecules in order to determine free energy differencies between different confirmations: Liphardt et al., Science **296**, 1832 (2002); Collin et al., Nature **437**, 231 (2005); Douarche et al., Europhys. Lett. **70**, 593 (2005).

S. Kim, Y.W. Kim, P. Talkner, J.Yi, Phys. Rev. E **86**, 041130 (2012).

Jarzynski: $\Delta F = -\beta^{-1} ln \langle e^{-\beta w} \rangle$ Crooks: $p_{\Lambda}(w) = e^{-\beta (\Delta F - w)} p_{\overline{\Lambda}}(-w) \Rightarrow p_{\Lambda}(w)$ and $p_{\overline{\Lambda}}(-w)$ cross at $w = \Delta F$

Work

Classical thermally isolated system:

$$w = H(z(\tau), \lambda(\tau)) - H(z, \lambda(0))$$
$$= \int_0^\tau dt \frac{dH(z(t), \lambda(t))}{dt}$$
$$= \int_0^\tau dt \frac{\partial H(z(t), \lambda(t))}{\partial \lambda} \dot{\lambda}(t)$$

Note that a proper gauge must be used in order that the Hamiltonian yields the energy.

z(t): solution of the Hamiltonian equations of motion

$$\dot{z}(t) = \{H(z(t), \lambda(t)), z(t)\}$$

with z(0) = z: point in phase space

Work characterizes a process; it comprises information from states at distinct times. Hence it is not an observable. As such it would only present information about the state at a single instant of time.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

The measurement of the quantum versions of power- and energy-based work definitions requires different strategies.

1. Two energy measurements:

One at the beginning, the other at the end of the protocol yield eigenvalues $e_n(0)$ and $e_m(\tau)$ of $H(\lambda(0))$ and $H(\lambda(\tau))$.

 $w^e = e_m(\tau) - e_n(0) \implies$ fluctuation theorems.

$$H(\lambda(t)) = \sum_{n} e_{n}(t) \Pi_{n}(t)$$

 $\Pi_n(t)$: Projection operator on the eigenstate of $H(\lambda(t))$ with eigenenergy $e_n(t)$.

- J. Kurchan, arXiv:cond-mat/0007360 (2000);
- H. Tasaki, arXiv:cond-mat/0009244 (2000);
- P. Talkner, E. Lutz, P. Hänggi, Phys. Rev E 75, 050102 (2007).

2. Power-based work:

Requires a continuous measurement of power.

E.g. for $H(\lambda) = H_0 + \lambda Q$, a continuous observation of the generalized coordinate Q is required leading to a freezing of the systems dynamics in an eigenstate of Q.

$$w^p_N = \sum_{k=1}^N \dot{\lambda}(t_k) q_{lpha_k} rac{ au}{N-1} , \quad Q = \sum_lpha q_lpha \Pi^Q_lpha$$

Fluctuation theorems hold only if $[H_0, Q] = 0$ or equivalently $[H(\lambda(t)), H(\lambda(s))] = 0$ for all $t, s \in (0, \tau)$. Hence the equivalence of the power- and energy-based work definitions for classical systems fails to hold in quantum mechanics.

Example: LANDAU-ZENER

$$H(t) = rac{vt}{2}\sigma_z + \Delta\sigma_x, \quad -\tau/2 \le t \le \tau/2$$

$$\label{eq:v} \begin{split} v &= 5\Delta^2/\hbar, \quad \tau = 20\hbar/\Delta\\ N &= 10, \; 10^2, \; 10^3, \; 10^4, \; \text{energy based}. \end{split}$$

B.P. Venkatesh, G. Watanabe, P. Talkner, New J. Phys. 17, 075018 (2015).

Work pdf from two energy measurements

$$p_{\Lambda}(w) = \sum_{n,m} \delta(w - e_m(\tau) + e_n(0)) p_{\Lambda}(m, n) : \qquad \text{work pdf}$$
$$H(\lambda(t)) = \sum_{n,m} e_n(t) \prod_{n \in I} (t) \qquad \text{spectral rep}$$

$$H(\lambda(t)) = \sum_{n} e_{n}(t) \Pi_{n}(t)$$
 spectral rep.

$$p_{\Lambda}(m,n) = \operatorname{Tr}\Pi_{m}(\tau) U_{\Lambda}\Pi_{n}(0)\rho(0)\Pi_{n}(0) U_{\Lambda}^{\mathsf{T}} \qquad \text{joint prob.}$$
$$\Lambda = \{\lambda(t)|0 \le t \le \tau\} : \qquad \text{protocol}$$

$$U_{\Lambda} = U_{\tau,0}(\Lambda), \quad i\hbar \frac{\partial}{\partial t} U_{t,s}(\Lambda) = H(\lambda(t))U_{t,s}(\Lambda), \quad U_{s,s}(\Lambda) = \mathbb{1}$$

<□ > < @ > < E > < E > E のQ @

CROOKS RELATION, $p_{\Lambda}(w) = e^{-\beta(\Delta F - w)} p_{\bar{\Lambda}}(-w)$, follows from two requirements

(i) The diagonal elements of the initial states of the forward and the backward process are both given by Boltzmann factors for the respective parameters $\lambda(0)$ and $\lambda(\tau)$ and same temperature β^{-1} , i.e. the diagonal elements of the respective density matrix $\rho(t)$ is given by

$$egin{aligned} \Pi_n(t)
ho(t)\Pi_n(t) &= Z^{-1}(t)e^{-eta e_n(t)}\Pi_n(t)\ &Z(t) &= \sum_n e^{-eta e_n(t)}d_n(t) \quad t=0, au\ &d_n(t) &= {
m Tr}\Pi_n(t) & {
m degeneracy of } e_n(t) \end{aligned}$$

(ii) Time-reversal invariance

time-reversal invariance

$$\begin{array}{l} H(\lambda(t)) = \theta H(\epsilon_{\lambda}\lambda(t))\theta^{\dagger} \\ \Longrightarrow \\ U_{s,t}(\Lambda) = U_{t,s}^{-1}(\Lambda) = \theta^{\dagger} U_{\tau-s,\tau-t}(\bar{\Lambda})\theta \end{array}$$

D. Andrieux, P. Gaspard, Phys. Rev. Lett. **100**, 230404 (2008).

$$\begin{split} P_{\Lambda}(m|n)d_n(0) &= P_{\bar{\Lambda}}(n|m)d_m(\tau) \;, \text{ generalized detailed balance} \\ P_{\Lambda}(m|n) &= \mathrm{Tr}\Pi_m(\tau)U_{\Lambda}\Pi_n(0)U_{\Lambda}^{\dagger}/dn(0) \;, \quad \text{transition probability} \\ d_n(t) &= \mathrm{Tr}\Pi_n(t) \;, \quad t = 0, \tau \;: \; \# \; \text{of states with } e_n(t) \end{split}$$

gdb + canonical initial states \Leftrightarrow Crooks relation

Experiments

The classical fluctuation relations are experimentally confirmed for mechanical, electrical and molecular systems and are the basis of a method to determine free energy differences.

In quantum systems, projective energy measurements pose a severe problem.

Proposal of an experiment:

G. Huber, F. Schmidt-Kaler, S. Deffner, E. Lutz, Phys. Rev. E **101**, 070403 (2008).

First experiment:

S. An et al. Nat. Phys. 11, 193 (2015).

Alternative method avoiding projective measurements: R. Dorner, S.R. Clark, L. Heaney, R. Fazio, J. Goold, V. Vedral, Phys. Rev. Lett. **110**, 230601 (2013); L. Mazzola, G. De Chiara, M. Paternostro, Phys. Rev. Lett. **110**, 230602 (2013); M. Campisi, R. Blattmann, S. Kohler, D. Zueco, P. Hänggi, New J. Phys. **15**, 105028 (2013).

Experimental confirmation:

T. Batalhão et al., Phys. Rev. Lett. 113, 140601 (2014).

Can generalized measurements be of help?

Generalized measurements

In QM the measurement of an observable \mathcal{A} in a state ρ (i) assigns to \mathcal{A} a real value *a* with probability p_a (ii) transforms the state ρ of the system at the instant before the measurement to a new state after the measurement:

$$\rho_{\mathsf{a}}^{\mathsf{pm}} = \phi_{\mathsf{a}}(\rho)/p_{\mathsf{a}}$$

The *measurement operation* $\phi_a : TC(\mathcal{H}) \to TC(\mathcal{H})$ is a linear, positive and contractive map.

Hence it can be represented as (K. Kraus, States, Effects and Operators, Springer 1983)

$$\phi_{a}(\rho) = \sum_{\alpha} M^{a}_{\alpha} \rho M^{a\dagger}_{\alpha}$$

 $M^{\mathsf{a}}_{lpha} \in B(\mathcal{H})$: Kraus operators

 $p_a = \text{Tr}\phi_a(
ho)$: probability to find a

Energy measurements

$$H(\lambda(t)) = \sum_{n} e_{n}(t) \Pi_{n}(t)$$

 ϕ_n^t measurement operation of the observable $\Pi_n(t)$. For a *projective measurement* ϕ_n^t becomes

 $\phi_n^t(\rho) = \Pi_n(t)\rho\Pi_n(t)$ Lüders-von-Neumann rule

It then is a **REPRODUCIBLE** and **ERROR-FREE** measurement:

$$\phi_n^t(\phi_n^t(
ho)) = \phi_n^t(
ho)$$
 reproducible
 $p(n|m) \equiv \text{Tr}\phi_n^t(\Pi_m(t)/d_m(t)) = \delta_{n,m}$ error-free

If $\Pi_n(t) = |n; t\rangle \langle n; t|$ a single Kraus operator suffices to represent any error-free measurement operation, i.e. $\phi_n(\rho) = M_n \rho M_n^{\dagger}$. The Kraus operator then is of the form

$$M_n = |\psi_n(t)\rangle\langle n;t|$$

Staring from a canonical initial state and using generalized energy measurements one obtains for the work pdf

$$p^{\phi}_{\Lambda}(w) = \sum_{m,n} \delta(w - e_m(\tau) + e_n(0)) p^{\phi}_{\Lambda}(m, n)$$

$$p^{\phi}_{\Lambda}(m, n) = \operatorname{Tr} \phi^{\tau}_{m} \left(U_{\Lambda} \phi^{0}_{n} \left(\rho(0) \right) U^{\dagger}_{\Lambda} \right)$$

$$= Z^{-1}(0) \sum_{n'} e^{-\beta e_{n'}(0)} \operatorname{Tr} \phi^{\tau}_{m} \left(U_{\Lambda} \phi^{0}_{n} \left(\Pi_{n'}(0) \right) U^{\dagger}_{\Lambda} \right)$$

For a class of "typical" protocols with protocol and temperature independent energy measurements the validity of the Crooks relation

$$p^{\phi}_{\Lambda}(w) = e^{-eta(\Delta F - w)} p^{ar{\phi}}_{ar{\Lambda}}(-w)$$

excludes all energy measurement operations but projective ones. For the proof of a similar statement see B.P. Venkatesh, G. Watanabe, P. Talkner, New J. Phys. **16**, 015032 (2014).

Continuous energy measurements

Gaussian energy measurement

$$egin{split} M_E(t) &= rac{1}{(2\pi\mu^2)^{1/4}} \exp\left(rac{1}{4\mu^2}(H(\lambda(t))-E)^2
ight) \ M_E^\dagger(t) &= M_E(t) \end{split}$$

Gaussian failure distribution:

$$p_t(E|n) = \operatorname{Tr} M_E^2(t) \Pi_n(t) / d_n(t)$$
$$= \frac{1}{\sqrt{2\pi\mu^2}} \exp\left(\frac{1}{2\mu^2} (e_n(t) - E)^2\right)$$

with variance μ^2 which is independent of *n*. Joint pdf to find the energy *E* and *E'* in the beginning and at the end of the protocol Λ , respectively, for a canonical ρ_0

$$p_{\Lambda}^{\text{Gauss}}(E', E) = \text{Tr} M_{E'}^2(\tau) U(\Lambda) M_E(0) \rho(0) M_E(0) U^{\dagger}(\Lambda)$$
$$= \sum_{m,n} p_{\tau}(E'|m) p_0(E|n) p_{\Lambda}(m, n)$$

Work pdf:

$$p_{\Lambda}^{\text{Gauss}}(w) = \int dE' dE \delta(w - E' + E) P_{\Lambda}^{\text{Gauss}}(E', E)$$
$$= \int \frac{dw'}{\sqrt{4\pi\mu^2}} e^{-(w - w')^2/(4\mu^2)} p_{\Lambda}(w)$$

Generalized Crooks relation

$$p_{\Lambda}^{Gauss}(w - \beta \mu^2) = e^{-\beta(\Delta F - w)} p_{\overline{\Lambda}}^{Gauss}(-w - \beta \mu^2)$$

Generalized Jarzynski equality:

$$\langle e^{-eta w}
angle = e^{-eta (\Delta F - \mu^2 eta)}$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

G. Watanabe, B.P. Venkatesh, P. Talkner, Phys. Rev. E 89, 052116 (2014).

Work meter

Device proposed by De Chiara, Roncaglia and Paz, (New J. Phys. **17**, 035004 (2015)) gives work by a single measurement.

P: momentum conjugate to the pointer-position $X = \int dx \ x \ \mathbb{Q}_x$, $\mathbb{Q}_x = |x\rangle \langle x|$.

$$p_{\Lambda}^{X}(x) = \operatorname{Tr}_{S+P} \mathbb{Q}_{x} \tilde{U}_{I} U_{\Lambda} U_{I}^{\dagger} \rho(0) \otimes \sigma_{0} U_{I} U_{\Lambda}^{\dagger} \tilde{U}_{I}$$
$$= \sum_{\substack{m \\ n,n'}} p_{\Lambda}(m,n,n') \sigma_{0}(x - \kappa w_{m,n}, x - \kappa w_{m,n'})$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

 $p_{\Lambda}(m, n, n') = \operatorname{Tr}_{S} \Pi_{m}(\tau) U_{\Lambda} \Pi_{n}(0) \rho(0) \Pi_{n'}(0) U^{\dagger}$ $\sigma_{0}(x, y) = \langle x | \sigma_{0} | y \rangle, \quad w_{m,n} = e_{m}(\tau) - e_{n}(0)$

Gaussian pointer

Gaussian pure state as initial state of the pointer:

$$\psi_0(x) = \frac{1}{(2\pi\mu^2)^{1/4}} e^{-x^2/(4\mu^2)} \Rightarrow \sigma_0(x, y) = \frac{1}{\sqrt{2\pi\mu^2}} e^{-(x^2+y^2)/(4\mu^2)}$$
$$\langle x \rangle_0 = 0, \quad \text{hence } w = x/\kappa \text{ is an unbiased work estimate}$$

$$p_{\Lambda}^{\text{pointer}}(w) = \sum_{\substack{m \\ n,n'}} \frac{1}{\sqrt{2\pi\mu_{w}^{2}}} e^{-\frac{1}{8\mu_{w}^{2}}[e_{n}(0) - e_{n'}(0)]^{2}} \\ \times e^{-\frac{1}{2\mu_{w}^{2}}\left[w - e_{m}(\tau) + \frac{1}{2}(e_{n}(0) + e_{n'}(0))\right]^{2}} p_{\Lambda}(m, n, n') \\ \mu_{w} = \frac{\mu}{\kappa}$$

◆□ ▶ < 圖 ▶ < 圖 ▶ < 圖 ▶ < 圖 • 의 Q @</p>

Special cases

(1) Stationary initial state: $[H(\lambda(0)), \rho(0)] = 0$ gives

$$p_{\Lambda}(m, n, n') = \operatorname{Tr}\Pi_{m}(\tau)U_{\Lambda}\Pi_{n}(0)\rho(0)\Pi_{n'}(0)$$
$$= p_{\Lambda}(m, n)\delta_{n, n'}$$

$$p_{\Lambda}^{\text{pointer}}(w) = \sum_{m,n} rac{1}{\sqrt{2\pi\mu_w^2}} e^{-rac{1}{2\mu_w^2}[w-e_m(au)+e_n(0)]^2} \ = \int dw' rac{1}{\sqrt{2\pi\mu_w^2}} e^{-rac{1}{2\mu_w^2}(w-w')^2} p_{\Lambda}(w')$$

(ロ)、(型)、(E)、(E)、 E) の(の)

(2) accurate measurement

$$p_{\Lambda}^{\text{pointer}}(w) = \sum_{\substack{m,n'\\n,n'}} \frac{1}{\sqrt{2\pi\mu_{w}^{2}}} \underbrace{e^{-\frac{1}{8\mu_{w}^{2}}[e_{n}(0)-e_{n'}(0)]^{2}}}_{\rightarrow \delta_{n,n'} \text{ for } \mu_{w} \rightarrow 0}$$
$$\times e^{-\frac{1}{2\mu_{w}^{2}}\left[w-e_{m}(\tau)+\frac{1}{2}(e_{n}(0)+e_{n'}(0))\right]^{2}} p_{\Lambda}(m,n,n')$$

In the limit of accurate measurements $\mu_w = \frac{\mu}{\kappa} \to 0$ the non-diagonal contributions with $n \neq n'$ are suppressed and the remaining Gaussian weights approach delta-functions.

$$p^{ extsf{pointer}}_{\Lambda}(w) o p_{\Lambda}(w) \quad extsf{for} \ \mu_w o 0$$

(3) weak measurement

$$p_{\Lambda}^{\text{pointer}}(w) = \sum_{\substack{m \\ n,n'}} \frac{1}{\sqrt{2\pi\mu_{w}^{2}}} \underbrace{e^{-\frac{1}{8\mu_{w}^{2}}[e_{n}(0)-e_{n'}(0)]^{2}}}_{\rightarrow 1 \text{ for } \mu_{w} \rightarrow \infty} \\ \times e^{-\frac{1}{2\mu_{w}^{2}}\left[w-e_{m}(\tau)+\frac{1}{2}(e_{n}(0)+e_{n'}(0))\right]^{2}} p_{\Lambda}(m,n,n')$$

For a weak measurement, large $\mu_w=\frac{mu}{\kappa}$ the distribution of becomes Gaussian with mean value

$$\langle W
angle^{\mathsf{weak}} = \mathsf{Tr} H(\lambda(au) U_{\Lambda}
ho(0) U_{\Lambda}^{\dagger} - \mathsf{Tr} H(\lambda(0))
ho(0)$$

and variance μ_w^2 . In contrast, in the accurate limit one obtains

$$\langle W \rangle = \sum_{n} \operatorname{Tr} H(\lambda(\tau) U_{\Lambda} \Pi_{n}(0) \rho(0) \Pi_{n}(0) U_{\Lambda}^{\dagger} - \operatorname{Tr} H(\lambda(0)) \rho(0)$$

Conclusions

- For projective measurements and "typical" non-degenerate work-values the Crooks relation is equivalent to a generalized detailed balance relation.
- Power-based work measurements do not yield meaningful results for quantum systems.
- For non-degenerate work- and energy-values the Crooks relation is only valid for protocol-independent measurements if they are projective.
- Continuous measurements with Gaussian measurement operators and constant variance obey modified fluctuation relations with protocol-independent modifications.
- The De Chiara-Roncaglia-Paz "work-meter" yields same results as for projective measurements in the accurate limit and the average work as difference of average energies in the weak limit.

Conclusions (cont.)

A no-go theorem

Definition

A protocol is TYPICAL if the eigenvalues of the initial and final Hamiltonians $H(\lambda(t)) = \sum_{m} e_m(t) \Pi_m(t)$, $t = 0, \tau$ satisfy the following three conditions:

(A) Any allowed work w corresponds to exactly one pair m, n with $w = e_m(\tau) - e_n(0)$.

(B) The energy-eigenvalues $e_n(0)$ and $e_m(\tau)$ are non-degenerate.

(C) Non-degeneracy of energy distance:

$$e_n(t) - e_{n'}(t) = e_k(t) - e_{k'}(t) \rightarrow n = k, n' = k'.$$

Theorem

Energy measurement operations $\phi_m^{(t)}$ that are independent of temperature and of the force protocol and, for typical protocols, lead to work statistics satisfying the Crooks relation are always projective: $\phi_m^t(\rho) = \Pi_m(t)\rho\Pi_m(t)$.

A similar statement starting from slightly different condition but leading to the same result was proved in

A no-go theorem (cont.)

B.P. Venkatesh, G. Watanabe, P. Talkner, New J. Phys. 16, 015032 (2014).

Sketch of a proof of the no-go theorem

With two generalized energy measurements ϕ_n^t the probability density of work becomes:

$$p^{\phi}_{\Lambda}(w) = \sum_{m,n} \delta(w - e_m(\tau) + e_n(0)) p^{\phi}_{\Lambda}(m, n)$$

$$p^{\phi}_{\Lambda}(m, n) = \operatorname{Tr}\phi^{\tau}_m(U_{\Lambda}\phi^0_n(\rho(0))U^{\dagger}_{\Lambda})$$

$$= Z^{-1}(0) \sum_{n'} e^{-\beta e_{n'}(0)} \underbrace{\operatorname{Tr}\phi^{\tau}_m(U_{\Lambda}\phi^0_n(\Pi_{n'}(0))U^{\dagger}_{\Lambda})}_{\equiv q_{\Lambda}(m, n|n')d_{n'}(0)}$$

Further, we require the validity of the Crooks relation

$$p^{\phi}_{\Lambda}(w) = e^{-\beta(\Delta F - w)} p^{\bar{\phi}}_{\Lambda(\bar{w})}$$
$$p\bar{h}i^{t}_{n}(\rho) = \theta^{\dagger} \phi^{t}_{n}(\theta \rho \theta^{\dagger}) \theta$$

Sketch of a proof of the no-go theorem (cont.)

If an allowed work value uniquely determines a pair of initial and final energies, as it is typically the case, then

Crooks relation
$$\Leftrightarrow Z(0)e^{\beta e_n(0)}p^{\phi}_{\Lambda}(m,n) = Z(\tau)e^{\beta e_m(\tau)}p^{\overline{\phi}}_{\overline{\Lambda}}(n,m)$$

$$\sum_{n'} e^{\beta(e_n(0) - e_{n'}(0))} \underbrace{q_{\Lambda}(m, n | n') d_{n'}(0)}_{\text{independent of } \beta} = \sum_{m'} e^{\beta(e_m(\tau) - e_{m'}(\tau))} \underbrace{q_{\bar{\Lambda}}(n, m | m') d_{m'}(\tau)}_{\text{independent of } \beta}$$

$$\sum_{n'} e^{\beta(e_n(0) - e_{n'}(0))} \underbrace{q_{\Lambda}(m, n|n') d_{n'}(0)}_{\text{independent of } \beta} = \sum_{m'} e^{\beta(e_m(\tau) - e_{m'}(\tau))} \underbrace{q_{\bar{\Lambda}}(n, m|m') d_{m'}(\tau)}_{\text{independent of } \beta}$$

Typically, also

$$e_n(t) - e_{n'}(t) = e_k(t) - e_{k'}(t) \Rightarrow n = k, n' = k'$$

holds. This implies

$$q_{\Xi}(m, n|n') = q_{\Xi}(m|n)\delta_{n,n'}$$
 for $\Xi = \Lambda, \bar{\Lambda}$

・ロト・日本・モト・モート ヨー うへで

hence, ϕ_n^0 and $\bar{\phi}_m^{\tau}$ error-free operations if they are Λ -independent

From the sums remain the n' = n and m' = m terms yielding the gdb relation

$$q_{\Lambda}(m|n)d_n(0) = q_{\bar{\Lambda}}(n|m)d_m(\tau)$$

For Λ -independent operations this implies

$$\phi_m^{t*}(\mathbb{1}) = \phi_m^t(\Pi_m(t)), \quad t = 0, \tau \quad (\star)$$

 ϕ_m^{t*} is the dual map: $\operatorname{Tr} u \phi_m^t(\rho) = \operatorname{Tr} \phi_m^{t*}(u) \rho$ for all bounded operators u and density matrices ρ .

For the Kraus operators $M^m_{\alpha}(t)$ defined as

 $\phi_m^t(\rho) = \sum_{\alpha} M_{\alpha}^m(t) \rho M_{\alpha}^{m\dagger}(t)$ with $M_{\alpha}^m(t) = M_{\alpha}^m(t) \Pi_m(t)$ (*) implies

$$\sum_{\alpha} M_{\alpha}^{m\dagger}(t) M_{\alpha}^{m}(t) = \sum_{\alpha} M_{\alpha}^{m}(t) M_{\alpha}^{m\dagger}(t)$$

yielding for non-degenerate eigenstates $(d_m(t) = \text{Tr}\Pi_m(t) = 1)$ that there is only a single $M_{\alpha}^m(t) = \Pi_m(t)$: measurement must be projective.
